

Synthetic, absorbable, multifilament braided suture, presented in violet or undyed.

Made of a copolymer of glycolide acid and L-lactide [poly (glycolide-co-L-lactide)].

The tissue reactivity is minimal.

Absorption occurs through progressive hydrolytic action, completed between 56 and 70 days.

The material retains approximately 75% of its initial tensile strength by the end of the second week.

Color code: Intense Violet

Frequently used in soft tissue coaptation procedures.

CHARACTERISTICS + BENEFITS

High tensile strength = Excellent tissue support.

Braided structure = Excellent handling.

Absorption through hydrolysis = Predictable absorption rate and minimal tissue reaction.

Cylindrical coated multifilament Thread = Smooth passage through the tissue.

Excellent knot coupling = Plasticity of the knot provides excellent security.

Hermetically sealed packaging = Ensured stability and sterility of the product.

ABOUT

When implanted in the tissue, the ATRAMAT® PGLA90 has minimal tissue reaction on a microscopic basis. However, ATRAMAT® PGLA90, offers a predictable absorption rate and high tensile strength above the USP standard, thus providing vital artificial support to the tissue during the critical healing period. The absorption occurs through progressive hydrolytic action completed in approximately 56 to 70 days. The material retains approximately 75% of its initial tensile strength at the end of the second week.

The suture has the following approximate percentages:

Glycolide 90%

L-lactide10%

Coating ≤1%

POLYGLACTIN 910 Poly(glycolide-co-lactide) (30/70) and calcium

Absorbable Sutures Atramat® PGLA90

Suturas Absorbibles

Atramat® PGLA90

Sutura sintética, absorbible, multifilamento trenzado en color violeta e incoloro.

Fabricado de un copolímero de ácido glicólico y L- lactide (poli (glicolida-co-L- Lactide)).

La reactividad tisular es mínima.

La absorción ocurre a través de una acción hidrolítica progresiva, la cual se completa entre 56 y 70 días.

Mantiene su resistencia tensil al 75% para el final de la segunda semana.

Código de color: Violeta Intenso.

Frecuentemente usado en los procedimientos coaptación de tejidos suaves.

CARACTERÍSTICAS + BENEFICIOS

Alta Resistencia tensil = Excelente soporte al tejido

Sutura trenzada = Excelente manipulabilidad

Absorción por hidrólisis = Tasa de absorción predecible y mínima reactividad tisular

Excelente acoplamiento del nudo = Acoplamiento plástico que provee excelente seguridad al nudo

Empaque hermético = Garantía de estabilidad y esterilidad del producto

ACERCA DE

Cuando se implanta en el tejido el PGLA90 Atramat® tiene mínima reactividad tisular en pruebas en microscopio. Sin embargo PGLA90 Atramat® ofrece una tasa de absorción predecible y resistencia tensil de acuerdo a los estándares de la USP, lo que provee el soporte artificial durante el proceso crítico de cicatrización. La absorción ocurre a través de una acción hidrolítica progresiva, la cual se completa entre 56 y 70 días.

El material mantiene su resistencia tensil al 75% para el final de la segunda semana y el 50% durante la tercera semana.

Esta sutura está compuesta de:

Glicolide.....90%

L-lactide.....10%

Recubrimiento.....<1%

Poliglactin 910

Poli (glicolida-co-L- Lactide). (30/70) y estereato de Calcio.
